

THE GOOSE DEVELOPMENT KIT

From **goose** to the **GDK**

Unbundling an open-source agent into reusable
components

We built an agent in the open

- Used across Block
- Forked by several large companies
- Donated to the Agentic AI Foundation

Many agents. A missing layer.

What we have

- Complete coding agents
- Opinionated interfaces
- Vertically integrated stacks

What builders need

- Agent capabilities
- Embeddable local inference
- Open standards support

The opportunity is below the application layer.

The GDK is **goose unbundled**

goose-sdk · unified API + UniFFI bindings

goose-agent · execution and tool use

goose-providers

goose-context-management

goose-local-inference · local model execution

goose-sdk-types · shared SDK types

Composable in Rust. Embeddable elsewhere.

Cross-language bindings generated with [UniFFI](#)

Building on open protocols

Your tools & policies

GDK components

goose is one important client of the GDK—not the container required to access it.

THE GOOSE DEVELOPMENT KIT

Build your agent—not the stack underneath it.
